

Nectria cinnabarina – photos de Léon Huet

Stade anamorphe

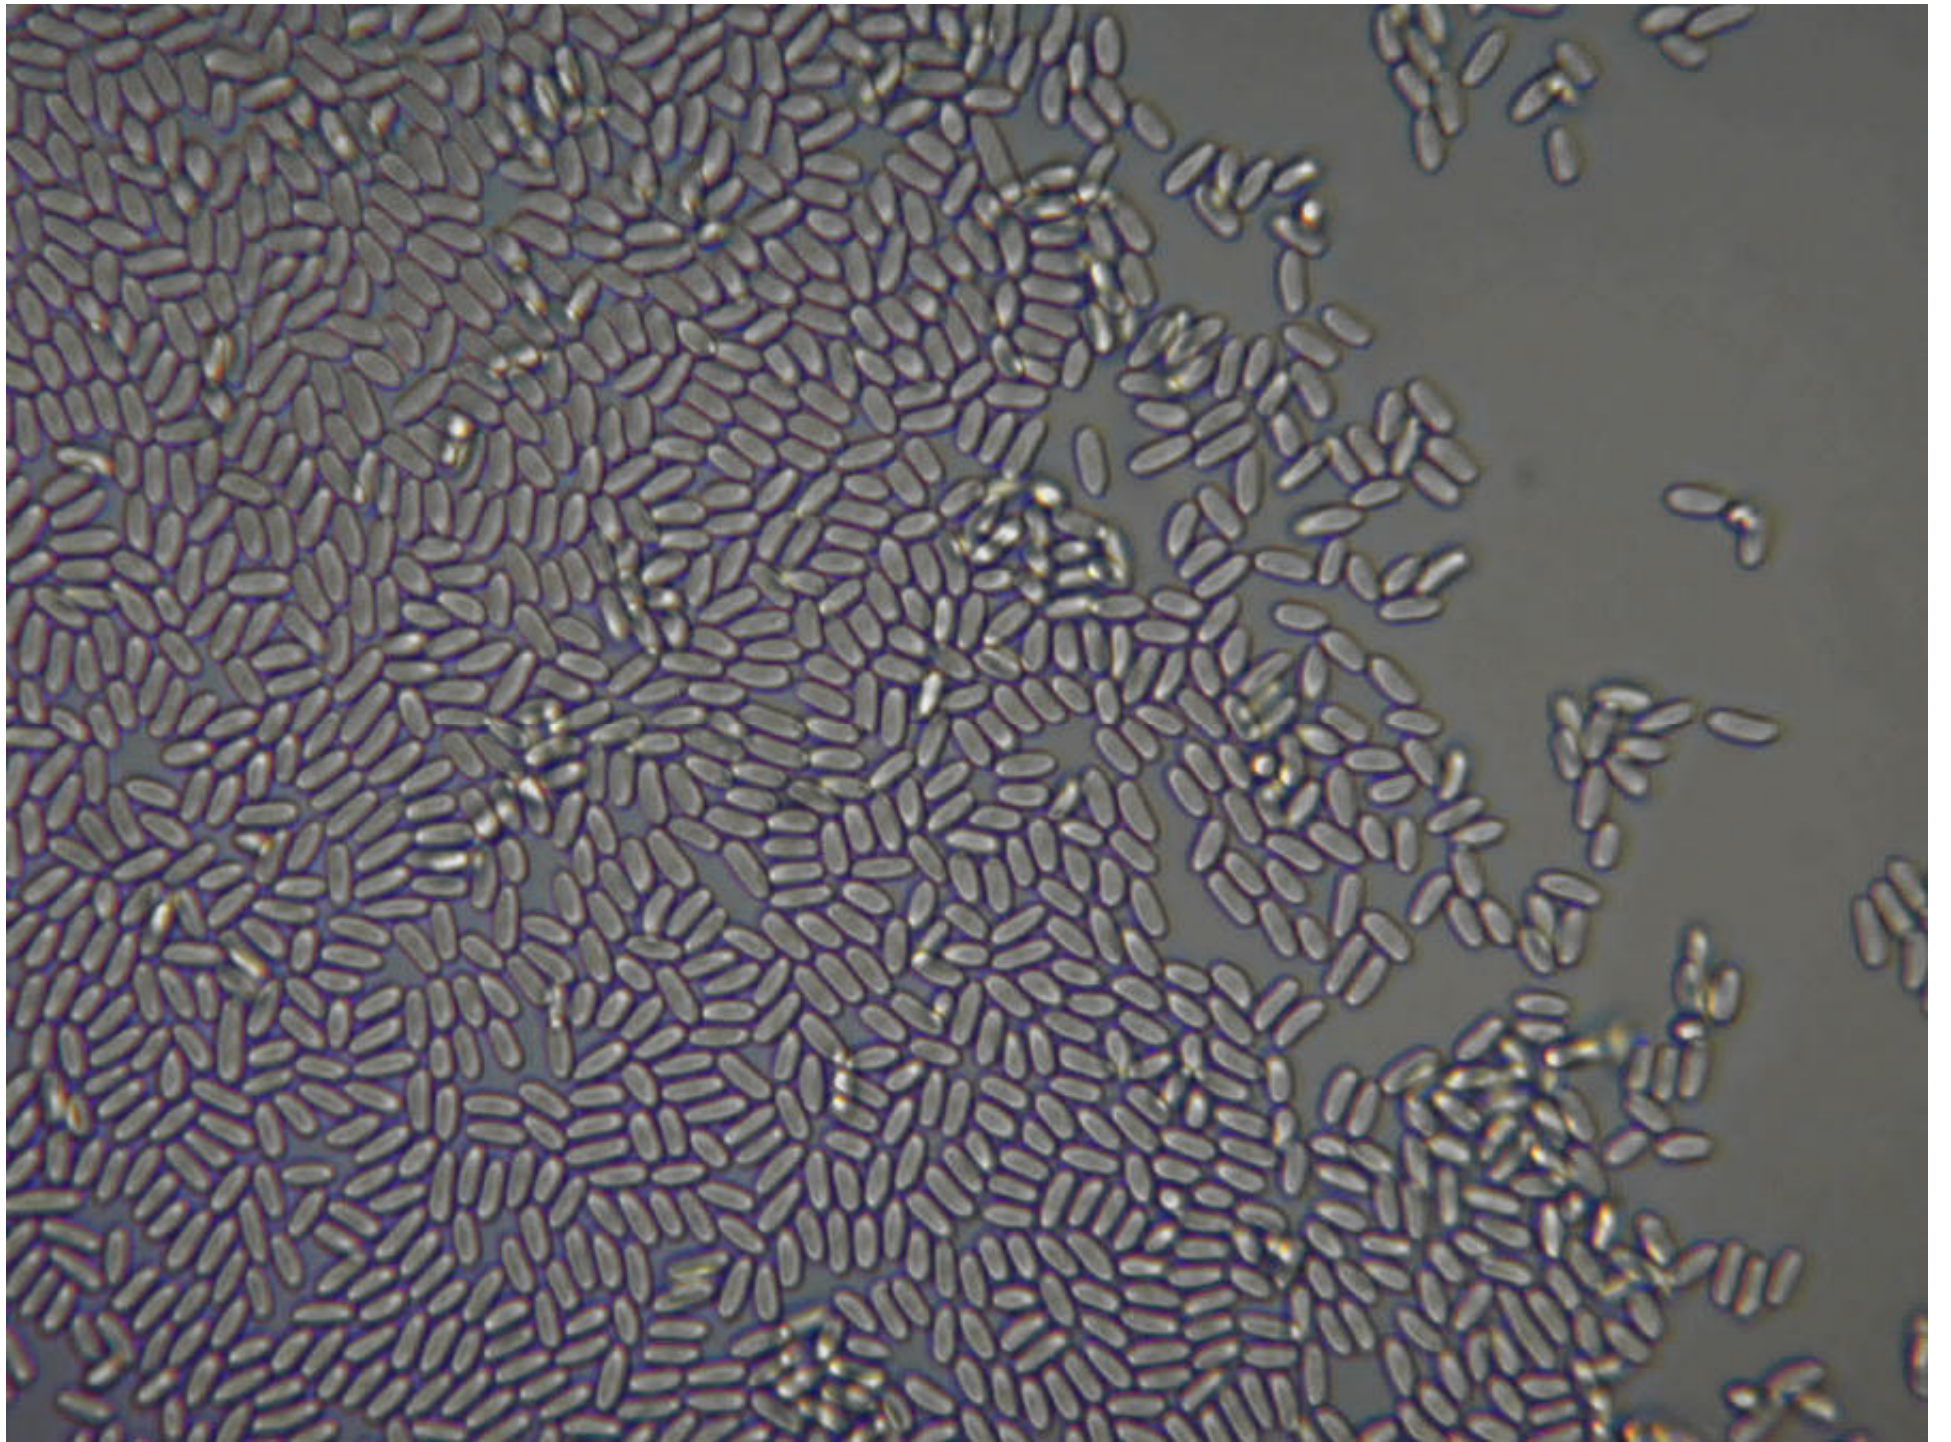

A light micrograph showing a long, thin, pinkish-purple filamentous structure, identified as a conidiophore, extending diagonally across the frame. The structure has a slightly irregular, beaded appearance. Numerous small, oval, light-colored spores are scattered throughout the background. A black line points from the text label to the main body of the conidiophore.

Conidiophore
